

Cognitive Psychology for Young Children (幼兒認知發展與教育)

Course Description

This course will cover topics in cognitive psychology including perception, attention, memory, knowledge, problem solving, reasoning, and language comprehension and production. Classical theories and experiments in these areas will be reviewed, in addition to applications of this work to practical problems. Some cognitive issues will be discussed from a cognitive science or neuropsychological perspective. Although the course overviews a broad range of topics, an attempt will be made to focus in detail on at least one selected issue each week. The class will typically be half lecture and half seminar format, although this may vary for guest lecturers.
